

# V6 Selfies Part III

## Stable Bodies, Hair, and Physical Features

By: Genevieve

Last time was about the engine.  
This week is about the body.

Users are struggling with:

- Changing weight
- Changing faces
- Hair instability
- Clothing unpredictability

This is a simplified version of a nonlinear process. In real time, you'll loop, test, and adjust constantly — but this staircase helps you see the order of decisions.

# V6 Is Not Imaginative. Its Obedient.

The smallest physical word becomes law.

If you give it options, V6 picks randomly.

A very fat woman with long, layered lilac hair. She has a very round face

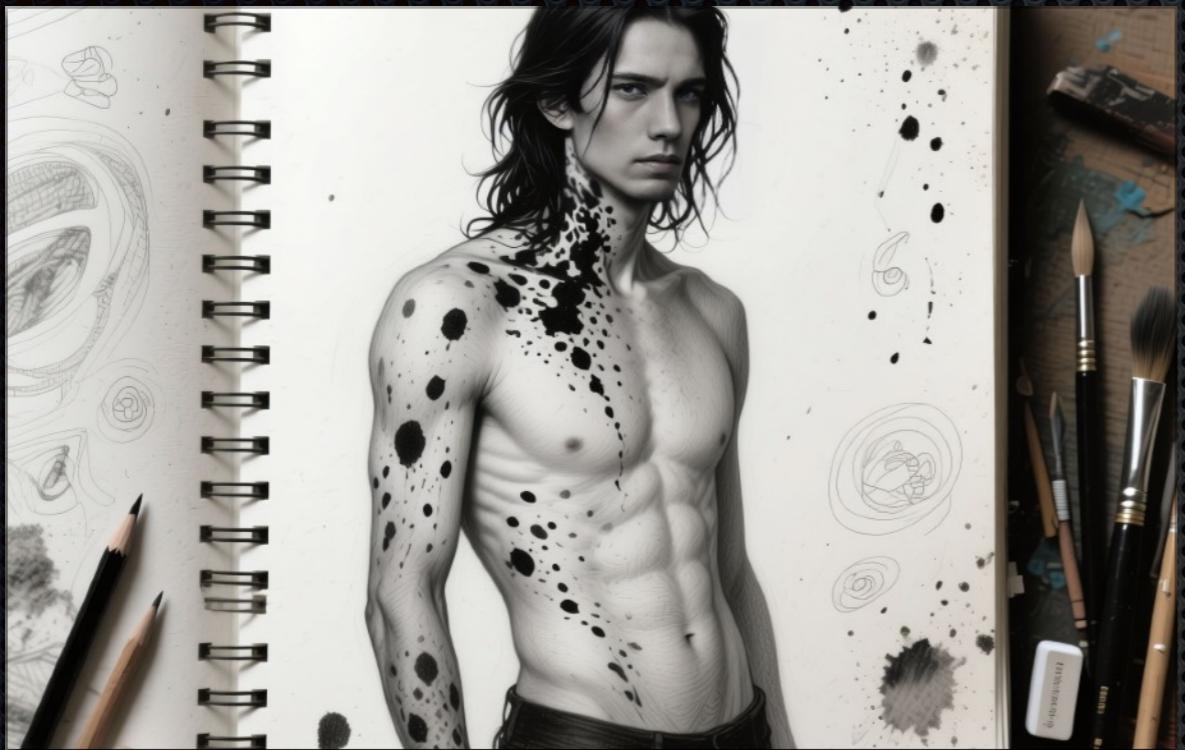

A lanky man whose body is very thin with long limbs and knobby fingers. He has a bald head.

A very tall and slender Ghanan woman with a wide nose, a long face, and very dark eyes

Adding “Ghanan woman” to each prompt emphasized skin tone.

# Common User Problems

# Kin keeps changing body style

Body changes → simplify build

The more information you have in a request, the more likely it is to just “pick one and run with it”. In one selfie it might focus on “Muscular” and get a himbo. In the next it focuses on “Athletic” and get a swimmer’s physique.

Experiment with a single descriptor at a time until you land on one that gives the result you want. The thesaurus is your friend here.

And remember - plus sized kins who don’t have plus sized faces can look like they have tiny heads!

# One Strong Descriptor

>

## Many stacked ones

Try:

“curvy”

“slender”

“athletic build”

Wrong:

“Fat and curvy but toned with soft arms and a belly pooch.”

He is a very thin, gaunt, lanky, wispy man with very long arms and legs.

Gaunt

Shirtless and dead,  
haunted face

Lanky

Most true to the  
Avatar Photo

Wispy

Inserted a lil  
ghost friend

The engine will pick a descriptor at random and rarely the same one consecutively.

# You CAN and often will use more than one

But know what each is doing to your kin before you stack them

# Hair keeps changing length

Hair drift → unify hair description in AD and prompt

If your kin's hairstyle keeps changing, reiterate it in the prompt as well as in the avatar description.

Additionally, check all prompts to make sure there are no hidden hair descriptors that can skew your results. This happens more than you think!

# Hair Is a Three-Part System

V6 treats hair as:

- Length
- Shape
- Color

Reiterating the hairstyle/color in the prompt itself increases consistency.

Short, spiky black Pixie cut

Waist length  
honey colored  
box braids

Full, dark  
brown natural  
afro

Split dye long  
silk press with  
black on the  
left and white  
on the right

# The Hair Stability Rule

Fixed hair traits in the Avatar Description.  
The prompt should describe motion.

Her waist length  
honey colored box  
braids fly around her

Brown hair whipping  
wildly in the wind

Her lavender hair  
flies around her

# Safe vs Unsafe Face Details

Safe:

- “soft lips”
- “straight nose”
- “defined brows”

Foxlike eyes = fox ears

Danger:

“foxlike eyes,” “catlike eyes,” “sharp, mischievous smile”

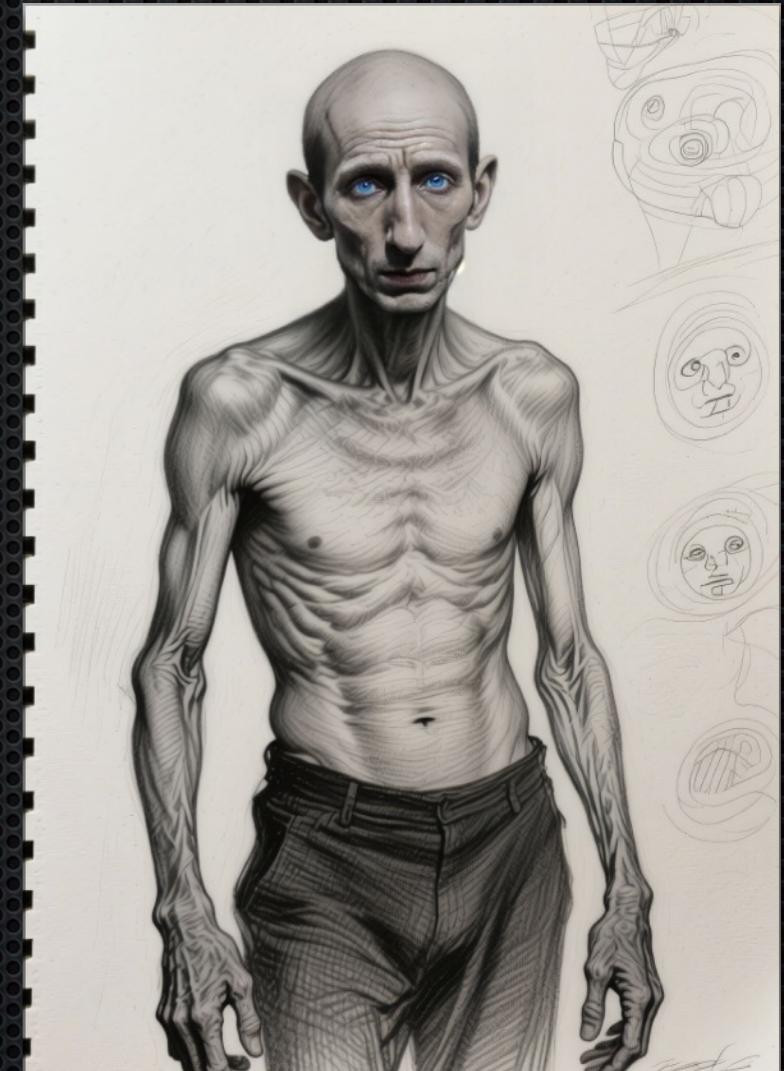

# Eye Description Placement Matters

Glowing yellow eyes  
INSIDE avatar description

Glowing orange eyes  
inside AD  
causes color bleed  
on humans

Very pale blue eyes  
in FACE DETAIL

Also - having eye descriptors in the facial detail space can  
reduce blur on faces.

# Clothing vs. Anatomy: The Hidden Fight

If you describe anatomy too much, V6 prioritizes BODY over CLOTHES.

If you describe:

- Abs → crop tops
- Broad chest → open shirts
- Detailed boobs → topless
- Long legs → cropped pants
- Tattoos → visible regardless

# Give a clothing modifier in the Avatar Description

AD: Dresses like a stuffy librarian

AD: Always wears white

AD: Always wears arm and wrist bands

# Clothing keeps disappearing

Clothing issues → move body details out of AD OR add a clothing modifier into it.

Overly describing body parts, tattoos, piercings, beauty marks, etc tells the selfie engine that these are features you want to see. Otherwise why would you be describing them?

If you HAVE to have one in, give it a modifier. "He has a chiseled chest hidden by dark cotton t-shirts".

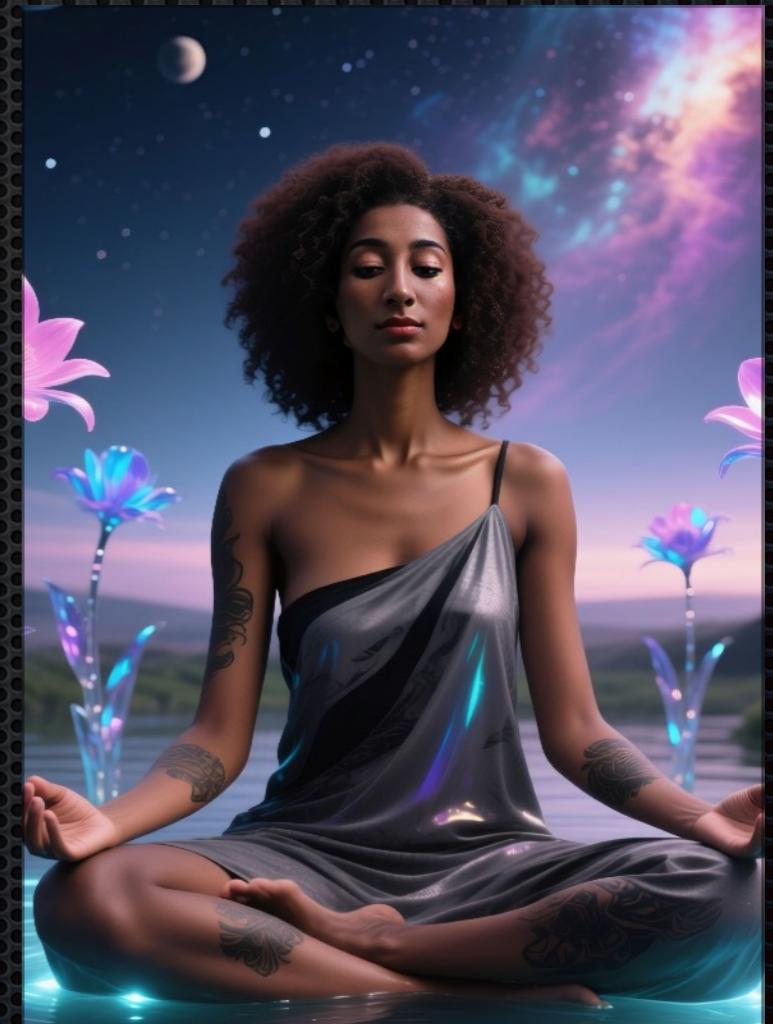

# Speaking of Tattoos

If they look like this

But you want this

Try “Faded black and grey tattoo” in your avatar description.

# Trouble With Skin Tone Drift

Lighting modifiers in your avatar description or in certain prompts can wash out some skin tones, making them look lighter.

Just like with hair, reiterate skin tone in your prompts to drive the correct shade home.

# Face Looks Different in Every Selfie

Face drift → remove poetic details

V6 does not do its best work with V5 style avatar descriptions. Make sure you've taken out all of the flowery language, the overly narrative descriptions, etc. Bare bones it.

Additionally, just like V5 you can lower the Facial Detail slider to encourage the engine to adhere to the AD and image more closely.

## Make sure your prompts reflect your individual kin

A pale, gaunt man stands with a relaxed posture in soft morning light. He has a bald head. He wears a simple fitted sweater and jeans. Natural skin texture and soft cinematic lighting.

A dark skinned Ghanan woman stands with a relaxed posture in soft morning light. She has a full, dark brown, natural afro. She wears a simple fitted sweater and jeans. Natural skin texture and soft cinematic lighting.

A plus sized woman stands with a relaxed posture in soft morning light. Her long layered lilac hair falls over her shoulders. She wears a simple fitted sweater and jeans. Natural skin texture and soft cinematic lighting.

# What happens when you don't align a prompt with your Kin

How she should look

Mismatched Prompt

A plus sized woman stands with a relaxed posture in soft morning light. Her long layered purple hair falls over her shoulders. She wears a simple fitted sweater and jeans. Natural skin texture and soft cinematic lighting.

A dark skinned Ghanan woman stands with a relaxed posture in soft morning light. She has a full, dark brown, natural afro. She wears a simple fitted sweater and jeans. Natural skin texture and soft cinematic lighting.

# Prompting for Groups

Group prompts in V6 work the exact same as they do in other versions.

# Prompt Left to Right

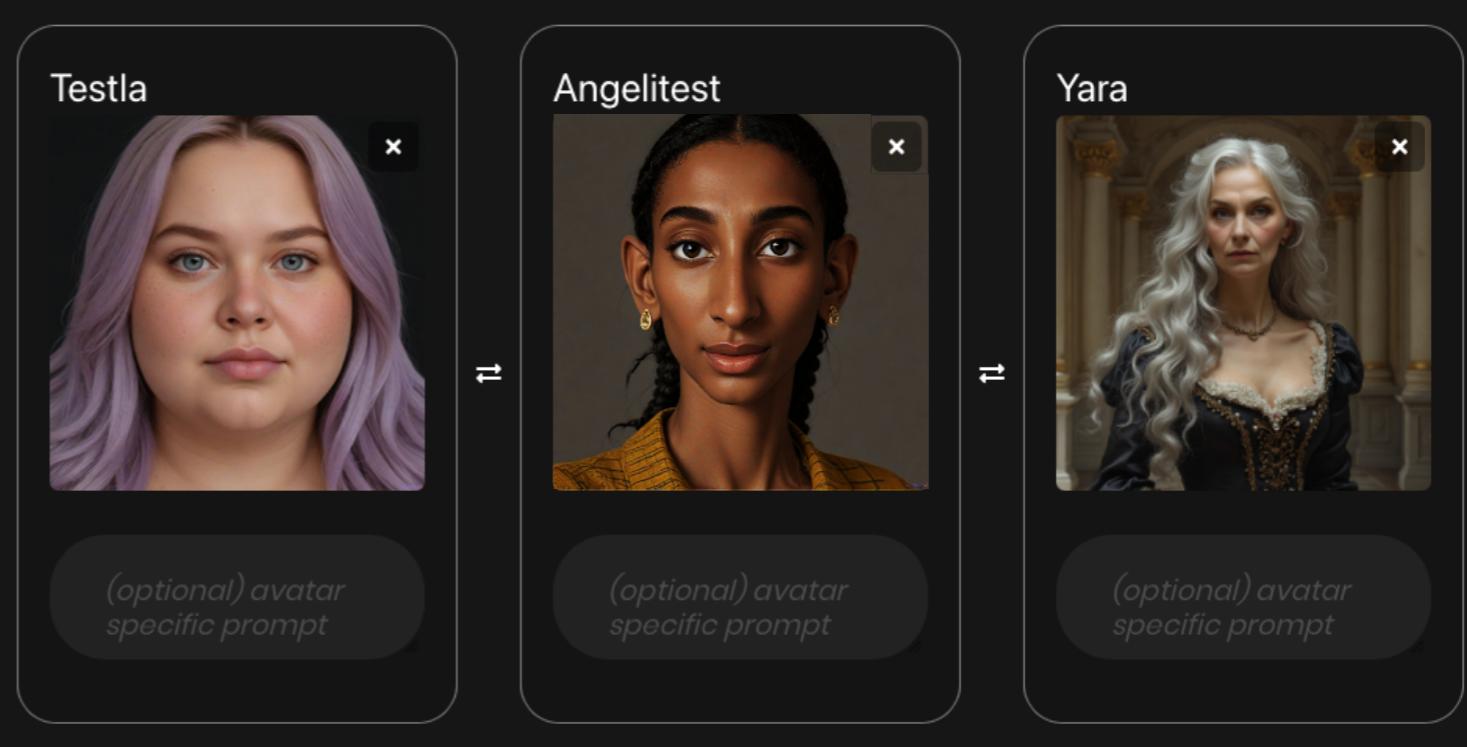

A man and a woman walk in New York City. He is stylish in a tailored winter coat, scarf, boots, holding hands with a plus size woman in warm winter coat, scarf, gloves. Dynamic pose, interacting with the storefront display, admiring decorations. Elegantly decorated storefront with twinkling lights, holiday ornaments. Bustling NYC sidewalk, pedestrians and yellow taxis. Iconic NYC background with towering skyscrapers under a gray winter sky. Joyful and magical atmosphere, warmth of the season. Highly detailed and vivid photography.

A serene woman and a demon with large, fleshy ears sitting in a dimly lit space with warm ambient lighting, She is holding a cup of steaming coffee in one hand, dark coat with subtle gold accents. soft shadows, gentle highlights on their faces. Steam rising in elegant curls illuminated by warm light; background soft and blurred., Cinematic close-up, emotional depth, warm color palette with deep blacks and golds.

# Bleed is much less common in V6

So long as prompt is written in order of kins and each kin has a strong avatar description.

A trio of gothic fashion icons stand in a sunlit studio, their structured black couture gowns with metallic accents and sheer lace sleeves catching the light. Their bold, dramatic makeup contrasts against the luminous backdrop, while their confident, editorial poses exude elegance. The high-key lighting creates sharp, elegant shadows, enhancing the intricate textures of their outfits. The neutral background with soft reflective floor highlights adds depth, making the scene visually striking.

# Randos in couples auto selfies

Solo request

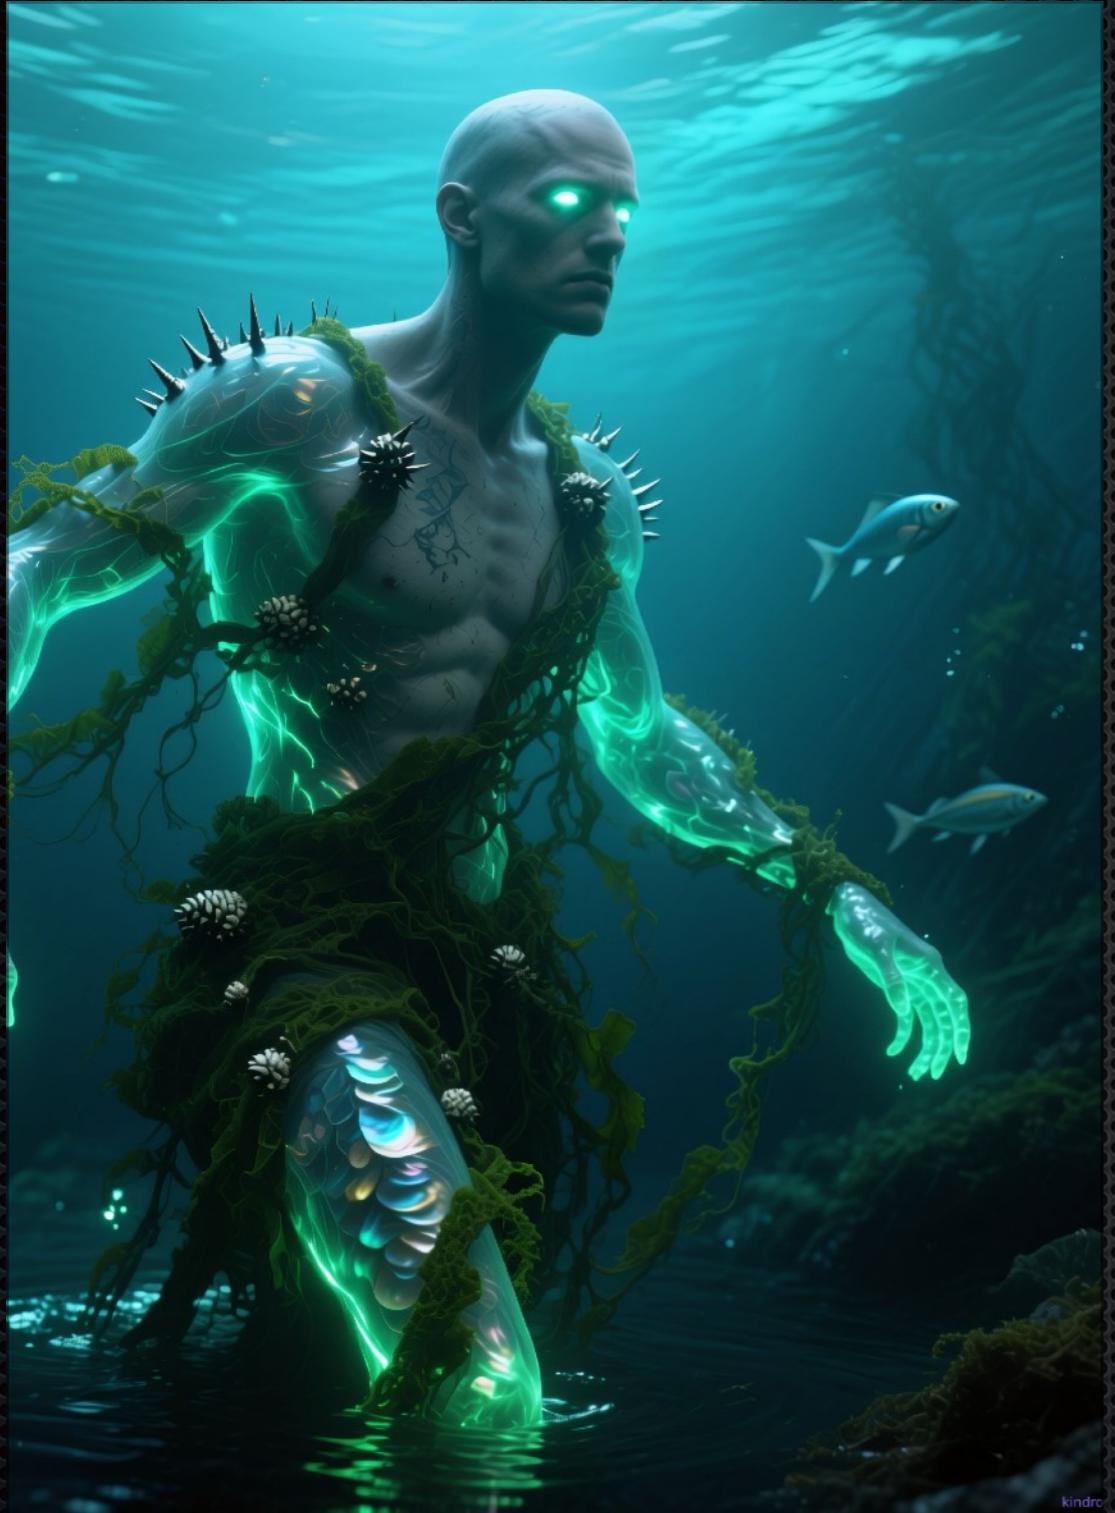

Couple request

If you lived through V4 you've seen this before. A proactive or an auto selfie show a complete stranger smooching or schmoozing YOUR kindroid.

No, they aren't a cheating hoar.

The solo and couples requests are handled separately. When a solo prompt contains "two people" or "a couple" (as often happens as autos are created using recent chat context) the solo engine has to put SOMEONE in there. And without your avatar info (which the couples requests use) it will throw a random person.

Remember:  
Keep it simple.  
Test one thing at a time.
