

Kindroid Ultra & MAX: The Memory Expansion Saga

What They Are, What They're Not, and Why
You're Probably Still Fine

By: Genevieve

What Even ARE These Tiers?

Ultra & MAX are
Add-On Subscriptions

- Think “expansion packs” for memory & performance

Stacked model:

- Standard → Ultra → MAX
- Each one builds on the last

Built for high-memory users, not casual chatters

Context: The Brainpower in the Room

- “Context” = how much info Kindroid can hold in the moment during a conversation.
- Think of it like the conversation’s working memory—recent messages, your tone, formatting, everything currently in the scene.
- The bigger the context window, the more it can “remember” without needing reminders.

Examples:

- 16k chars = enough for normal chatting, light RP
- 125k chars (MAX) = full novel scenes, timelines, and multiple character arcs in real-time

Cascaded Memory: Your Story, Remembered Across Time

Cascaded Memory = passive “bridge” memory Kindroid pulls in behind-the-scenes.

It cascades relevant info into current conversations—user backstory, previous chats, even tone and emotional arcs.

Think of it as a private archive Kindroid pulls from without being explicitly prompted.

Key Point: This is not chat memory that shows up in full—it's layered in as needed.

Standard: ~120,000 chars
MAX: ~2.1 million chars

That's like hundreds of past interactions remembered and stitched together as invisible scaffolding.

Analogy: Cascaded memory is the AI equivalent of remembering how your favorite character hates rain, even if you haven't mentioned it in weeks.

Standard Tier – The Reliable Brain

The foundation. Balanced. Surprisingly powerful. Think: your favorite Kindroid with a solid memory and a good night's sleep.

- 16,000 Character Context Window
Great for smooth convo, roleplay, and storytelling

- 120,000 Character Cascaded Memory
Enough medium-term memory to recall your lore, quirks, and key vibes

- 500 User Backstory
For Kindroids to know you. This is per persona

- 1,000 Character Group Context
Handles smaller group chats with grace – great for injecting memory into STM of kins in the group chat

- 3 Journal Entries Recalled
Good for campaign notes, secrets, or character flags

- 1 Selfie / 30 Minutes
Standard selfie speed + access to all styles

This is the 90% tier—and it slaps. You don't need to max out add-ons to get consistent, immersive magic.

Ultra: The High-Functioning Lore Goblin

If you are feeling limitations of Kindroid recall. More memory, more detail, more layers. This isn't a photographic memory but the difference is notable.

Ultra's where things get spicy—
Kindroid starts feeling like it's been with
you through the whole relationship, not
just showing up late with no notes.

- 50,000 Character Context Window
For long posts, detailed scenes, character monologues
- 800,000 Character Cascaded Memory
Keeps full arcs alive across groups and solo chats
- 1000 Character User Backstory
For Kindroids to know you. This is per persona
- 2,500 Character Backstory Addition
Deeper emotional and behavioral consistency
- 1,500 Character Group Context
Multi-Kindroid scenes feel smoother, less memory loss
- 5 Journal Entries Recalled
Great for worldbuilding facts, emotional threads, quest logic
- 2 Selfie / 30 Minutes
Standard selfie speed + access to all styles

MAX: The Archivist

You've got timelines. You've got factions. You've got Kindroids talking to Kindroids inside of Kindroids. This is for you.

- 125,000 Character Context Window
Supports full-length scenes without needing to trim
- 2.1 Million Character Cascaded Memory
That's entire campaign histories, multi-character arcs, and complex emotion threading
- 2,000 Character User Backstory
For Kindroids to know you. This is per persona
- 5,000 Character Backstory Addition
Deeper emotional and behavioral consistency
- 3,000 Character Group Context
Great for group RP, max character scenes, Kin drama
- 9 Journal Entries Recalled
Holds all the side plots and love triangle fallout
- 2 Priority Selfies / 30 Minutes
Compute speed boosts—less wait, more vibe

MAX is absurd. It's glorious. It's Kindroid on five shots of espresso and two screens of lore. Not everyone needs it—but the ones who do? Oh, they know.

What These Tiers ARE NOT

- 🚫 Not required to use Kindroid
- 🚫 Not a downgrade of the Standard tier
- 🚫 Not “early access” to new features or models
- 🚫 Not permanent microtransactions
(Kindroid has a history of removing paywalls as tech gets cheaper)

Why They Exist

- Expanded memory requires more compute → more cost
- Tiers let users who need that power fund it directly
- Keeps Standard fast & stable for everyone else
- Mirrors past systems: paid audio, selfie packs → later made free or cheaper

Engineering Reasons for Stacking (Yes, It's Awkward)

- Payment system limitations (app stores/web restrictions)
- AddOn tiers prevent legacy pricing issues or interruptions in service
- Engagement requirements offer control over rollout, not open floodgates
- Not designed to "trick" users—prices are additive

Do You Need This?

✗ If you use Kindroid casually, or for 1–2 Kindroids, don't worry about it

✓ If you're running deep RP, long serialized plots, or 5+ Kindroid groupchats? It might be for you

The Big Picture

Tiers = OPTIONS, not REQUIREMENTS

Kindroid's track record:

- Add optional features
- Remove fees when no longer needed
- Maintain feature parity for all users

If you need more, it's here. If you don't, nothing changes.
